INSA SUMMER CAMP | GROUP PROJECT PRESENTATION

EthiopiaNet

Building cybersecurity awareness for safer digital learning

Presenter: Nardos Getachew
Member: Samuel Getachew
Project status: Work in progress

Purpose • Current progress • Demonstration • Next steps

1. The problem I want to address

Students use digital tools every day, but safe online habits need practice and clear guidance.

ONLINE RISKS

Phishing, suspicious links, weak passwords, and unsafe sharing can put accounts and information at risk.

LEARNING GAP

Cybersecurity information can feel technical or difficult to apply in everyday student life.

OPPORTUNITY

A student-friendly learning project could make awareness more practical and approachable.

The problem statement is the motivation for the project—not a claim that the platform has already solved it.

2. The EthiopiaNet idea

EthiopiaNet is intended to help students learn cybersecurity and make safer digital choices.

PROJECT GOAL

Create an accessible, student-focused place to learn digital safety and basic cybersecurity concepts.

DESIGN PRINCIPLES

Clear language • Practical examples • Responsible use • A learning-first approach

Important: describe this as the project's goal. Only call a feature complete if you can demonstrate it.

3. Who could benefit?

STUDENTS

Learn safer online habits, recognize common risks, and build confidence using technology.

TEACHERS / CLUBS

Potentially use structured awareness material to support digital-safety learning.

SCHOOL COMMUNITY

Potentially share practical cybersecurity awareness in an accessible format.

These are intended audiences. Adjust them to match the users and scope you have actually chosen.

4. Current progress: honest status

The project is partly built. I will show the parts that currently work and identify what is unfinished.

COMPLETED / WORKING

Before presenting, replace this text with 1–3 items you have personally tested.

IN PROGRESS

List the parts you have started but have not finished.

NOT STARTED / NEXT

List planned work that is not implemented yet.

Do not leave the bracketed placeholders in the final deck. If a feature is not tested, do not call it working.

5. Live demonstration

01	**Open the real project**	Show the actual application, repository, or prototype you have.
02	**Demonstrate one working path**	Choose a feature you have tested. Explain what you click and what happens.
03	**Show the current result**	Point out the visible output. Avoid claiming hidden functionality.
04	**Explain one limitation**	Say what is unfinished, what you learned, and what you will do next.

Demo rule: use your real screen and real results—no mockups presented as working software.

6. Next steps

STEP 1 — STABILIZE

Make the existing parts reliable; fix errors and test the main user path.

STEP 2 — IMPROVE

Refine the interface and content based on what students need.

STEP 3 — VALIDATE

Test with a small number of users, collect feedback, and prioritize changes.

Treat this as a proposed roadmap. Reorder it to match your actual code, time, and project requirements.

7. Challenges and what I am learning

CHALLENGES

Be ready to describe a real challenge you faced, such as debugging, organizing the project, or deciding what to build first.

LESSONS

Explain how you investigated the issue, what you tried, what worked, and what you would do differently.

Specific, honest examples are stronger than general claims.

Thank you

Our goal is to keep learning, improve the project step by step, and build something useful for student cyber security awareness.

Questions and feedback are welcome.
